

Bats by Danny

Appearance

Bats only mate once a year. Bats sleep in caves and hiding places so predators can't find them.

Habitat and Diet

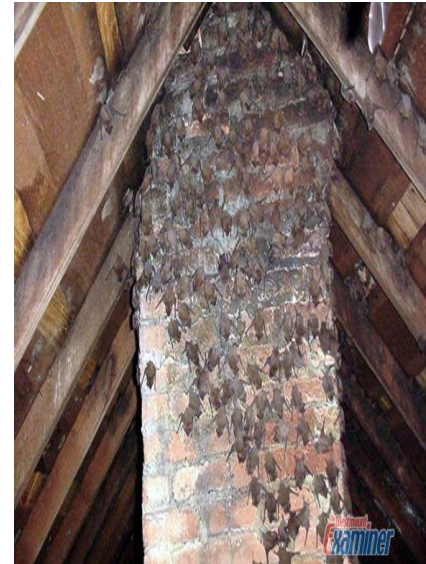

Baby bats drink from their mother's milk. Big bats may eat smaller bats. Bats drink nectar if it is nearby.

Adaptations

Some bats are never awake in the winter. When it is spring all of the bats come out and eat food.

Life Cycle

The red bat can have up to two to four babies. Babies fly away when they are three to five weeks old.

Interesting Facts

Bats only hunt when they are not hibernating. Female bats only give birth to babies in two servant seasons.
